

## Coding Challenge Week 5 Day 3

Create a function constructor called CustomObject and have a data field inside. Now try to create a child object called as childData and attach a prototype called addCola. All this function does is to add the word “Cola” for every value inside the object. The result should not damage the holding value by any sorts An example is given below.

```
{ a: 1, b: 2, c: 3 }.addCola() => { a: '1 Cola', b: '2 Cola', c: '3 Cola' }
```
