

# Coding Challenge Week 3 Day 2

Today is another day where you will be building a layout-related element. The goal of this challenge is to wire up your flexbox concepts. I would suggest that you rewatch the lecture and then perform the work. I want you to build a simple sidebar component (the one which you see on mobiles which you would be swiping from left to right), but with only flex-box. Here is the layout of it.

As you can see in the above image, you have a company logo followed by some two to three headings and then your profile picture (the grey circle), followed by the name. I want you to replicate this layout only with the help

of flexbox. Try to visualise each thing as a component and start wrapping them under. As I had told you in lecture, there is no hard and fast rule to

have only one flex display. Nested flex displays are completely fine. The image to the left of the document is an example of a sidebar. Try to replicate it. Don't worry about the colors and fonts (if you did it, then it's super cool), just focus on the layout.
