

Coding Challenge Week 4 Day 4

Since we started just the basics of JavaScript, I would like you to write a small program which asks for the first name and then the last name from the user (separately) and outputs 2 variables as a single name.

For example => first name = Sundeep, last name = Charan, output should be in the document as Hi Sundeep Charan.

Hint refer [here](#) to merge two variables together (Just watch the “The + Operator” section)

The next job which I expect you to do is to output in a blocking method the age of the user by getting the same.

For example => age = 20, output should be You are 20 years old.
