

Assignment Week 6 Day 3

Here it goes. Your first assignment of this week is to have a form validation using jQuery. Let me tell you in detail of the working mechanism. We will consider 3 states, empty, incorrect, correct. I have also linked a figma design file below. The design should be as close as possible. It's not just a guideline. Css props are there so just copy paste those, not an issue. Now back to discussing the states.

Empty state - Should show no errors, submit button should be disabled

Incorrect state - This is where some work kicks in, well whenever an input is being typed immediately you should show the following errors with the help of a red colored border and a small message beneath the input. The error messages are listed below.

1. Name, Password, Email - If the user focuses and simply blurs away without typing anything, it should have the error "Name/Password/Email is required"

2. Password - The length of the password should be at least 8 characters.

3. Email - It should be a valid email, that's it. Just look out for the @ and the . symbols

The error message should be relevant to the current action, that is you should not show the error "Password should be at least 8 characters", if the

user hasn't even typed something lol. I mean that makes sense right?. I **repeat, these error messages should pop immediately and not after blur.**

Correct State - If all the inputs are valid, then the borders should turn green, and now the user can be able to submit the form. In other words the button should not be disabled.

The figma design can be found [here](#). **jQuery is the requirement and not JavaScript. Using JavaScript will simply be considered as not valid.**
Good luck :)
